

Max Prop® Easy & Boomerang

Simple installation. Precise pitch control. Exceptional sailing performance.

Designed for straightforward installation and easy adjustment, the Max Prop® Easy combines the proven benefits of a feathering propeller with practical features that make setup, servicing and fine-tuning remarkably simple.

Max Prop® Easy — Designed for Simplicity

Ready to Install

The Easy propeller is supplied fully assembled, greased and ready to mount directly onto the propeller shaft. Installation requires only a simple hex wrench and can be completed in just a few minutes — no specialist technical skills are required.

Install or Remove It in the Water

Both installation onto and removal from the propeller shaft can be carried out while the boat is in the water, providing greater flexibility for owners and reducing the need for unnecessary haul-outs.

Factory-Set to Your Requirements

Each Easy propeller is supplied with the forward and reverse pitch settings specified by the customer at the time of order. If requirements change later, both settings can be easily customised by tightening or loosening the two adjustment screws located on the external surface of the propeller body.

Independent Forward & Reverse Pitch Adjustment

Forward and reverse pitch are independently adjustable, allowing each to be optimised specifically for the boat. Fine adjustment in 0.5° increments gives the owner precise control over propeller setup and performance.

Fine-Tune Without Hauling Out

Pitch adjustments can also be made while the boat remains in the water, making subsequent optimisation fast and convenient.

Simple to install • Easy to adjust • Fully customisable • In-water servicing

Max Prop® Boomerang — Automatic Feathering

The Boomerang takes the Easy concept a step further. It is an Easy-model feathering propeller equipped with a patented mechanism that automatically and immediately returns the blades to the feathered position when the engine is switched off while running in forward gear.

Feathers Automatically — Even When Stationary

Unique in its class, the Boomerang allows the blades to return to the feathered position even when the boat is stationary. There is no need to lock the propeller shaft to initiate feathering.

Ideal for Hydraulic Transmissions

Because shaft rotation does not need to be locked, boats fitted with hydraulic transmissions do not require the installation of a separate shaft brake to achieve reliable feathering.

A Major Advantage for Racing

For racing yachts, the Boomerang provides an important practical benefit: the propeller can be in its low-drag feathered position before the boat reaches the starting line, without relying on boat movement or additional shaft-locking procedures.
